the proceedings of the 12th world congress on genetics applied to livestock
production provide you with 816 papers representing the leading research in
livestock genetics around the globe this book covers all aspects of genetics
applied to livestock production in 44 sections next to the exciting plenary
speakers and the recurrent technical and species orientated sections there are
sections focusing on specific challenges for animal breeding for instance large
scale phenotyping of individual animals use of whole genome sequence data
and improving genomic prediction and sessions on the contribution that
genetics can make to societal challenges like animal welfare climate change
biodiversity or control of infectious diseases

this book covers a range of important topics on crop and animal genetics
breeding and genomics as well as biodiversity and genetic resources
conservation and utilization reflecting three thematic sections of working groups
of the biotechnology society of nigeria the topics range from agricultural
biotechnology including genetically modified organisms and gene editing for
agronomically important traits in tropical crops to nigeria's mega biodiversity
and genetic resources conservation this book will engender a deeper
understanding of underpinning mechanisms technologies processes and
science policy nexus that has placed nigeria as a leader in biotechnology in africa
the book will be useful reference material for scientists and researchers working

in the fields of food and agricultural biotechnology bioinformatics plant and animal genetics breeding and genomics genetic resources conservation and enhancement emphasizes recent advances in biotechnologies that could ameliorate the high level global food and nutrition insecurity through plant and animal genetics breeding as well as genomics provides detailed information towards harnessing indigenous bioresources for food and nutrition security and climate change adaptation introduces new frontiers in the area of genomics most especially their relevant applications in crop and animal breeding reviews biotechniques that could enhance plant genetic resources conservation and utilization discusses current biotechnological approaches to exploit genetic resources including the development of synthetic hexaploid wheat shw for crop adaptation to the increasingly changing global climate

particular focus on the challenges in breeding and lack of genetic diversity in modern dairy cattle explores ways of improving non production traits in cattle for more sustainable production detailed review of key developments in reproductive technologies and breeding programmes to further advance dairy cattle breeding

low and middle income countries lmics are home to diverse populations of livestock species adapted to various agro ecological zones production systems and harsh environmental conditions however the livestock in lmics have not been systematically improved and current low levels of productivity do not meet the demand for livestock products by a growing population recent advances in next generation sequencing and genotyping technologies have enabled the application of genomic selection in various livestock species in some western countries with great success despite the low adoption of genomic breeding in lmics livestock industry various studies and programs were initiated and some are still ongoing furthermore community based breeding programs cbbp have been initiated in many lmics with great benefits for smallholder livestock farmers

cbbps are based on the active participation of farmers from inception through to implementation and consider their needs views decisions breeding objectives and available infrastructure in africa for instance small ruminants cbbps have generated substantial genetic gains and socioeconomic benefits for rural poor farmers however the current challenges affecting the data recording and genetic evaluation of the cbbps in lmics are yet to be fully reported furthermore the cbbps are yet to integrate genomic selection in their breeding strategies for sustainable livestock breeding in lmics there is a need to assess the current status of livestock genomics and community based breeding strategies to identify the challenges and suggest mitigating strategies and future improvement strategy plans in this research topic we aim to collect findings from past and current livestock genomics and community based breeding programs the challenges the lessons learned the opportunities and future perspectives

research into equine artificial insemination has recently expanded with increasing horse numbers the developing leisure interest in horse riding and the realization of the economic advantages of artificial insemination this book provides a detailed reference book on the subject and covers its historical development relevant equine physiology current practices and future possibilities it is extensively referenced to allow further reading into specialized areas
